Printing History
Edition 6.0, #071213, Copyright 2013, All rights reserved.

FCC Compliance Statement: This device complies with part 15 of the FCC rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

For Users in the United States: This product is intended to be supplied by a UL listed Direct Plug-In Power Supply marked "Class 2" or a UL listed ITE Power Supply marked "LPS" with output rated 12VDC, 4.5A or higher. This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. In a domestic environment this product may cause radio interference, in which case the user may be required to take adequate measures. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:
- Re-orient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Use of shielded cables is required to comply with the Class B limits of Part 15 of the FCC Rules. You are cautioned that any changes or modifications not expressly approved in this manual could void your authority to operate and/or obtain warranty service for this equipment.

For Users in Canada: This digital apparatus does not exceed the Class B limits for radio noise for digital apparatus set out on the Radio Interference Regulations of the Canadian Department of Communications. Le present appareil numerique n’emet pas de bruits radioelectriques depassant les limites applicables aux appareils numeriques de la class B prescrites dans le Reglement sur le brouillage radioelectrique edict par le ministere des Communications du Canada.

Product Disposal
Do not dispose of the printer or supplies in the same manner as normal household waste. Consult your local authorities for disposal and recycling options.

Battery Notice
This product contains Perchlorate material. Special handling may apply. For more information, go to http://www.dtsc.ca.gov/hazardouswaste/perchlorate/

CAUTION!
TO PREVENT FIRE OR SHOCK HAZARD, DO NOT EXPOSE THE UNIT TO RAIN OR MOISTURE. TO REDUCE THE RISK OF ELECTRIC SHOCK, DO NOT REMOVE EXTERIOR PANELS. NO USER-SERVICEABLE PARTS INSIDE. REFER SERVICING TO QUALIFIED SERVICE PERSONNEL. OPERATE THE UNIT WITH ONLY THE PROPER ELECTRICAL SPECIFICATIONS AS LABELED ON THE PRINTER AND AC ADAPTER.

CAUTION!
USE OF CONTROLS OR ADJUSTMENTS OR PERFORMANCE OF PROCEDURES OTHER THAN THOSE SPECIFIED HEREIN MAY RESULT IN HAZARDOUS RADIATION.

CAUTION
RISK OF EXPLOSION IF BATTERY IS REPLACED BY AN INCORRECT TYPE. DISPOSE OF USED BATTERIES ACCORDING TO THE INSTRUCTIONS.
Interactive Feature in this PDF Document

There are interactive features that will allow you to jump to different locations within the document. Each listing in the Table of Contents is interactive. Place the cursor on either the words or the page number. A small hand with a pointing finger icon appears. Click on the line with the icon and the document will jump to that page. If you want to return to the Table of Contents, move the icon to the top of the page and click on the arrow marked TOC.

Navigating through the Index is similar. Place the icon on one of the listings or page numbers, click on it, and it will move to that page. The text relating to the Index listing will appear in red. Returning to the Index can be done by clicking on the arrow marked Index.

Index
THANK YOU...

...for choosing an LX900 Color Label Printer. The LX900 Printer will print razor-sharp text and barcodes, vibrant colors, and even stunning photo-realistic photographs directly onto rolls of labels, card stock and a variety of other approved media.

This User’s Manual is your complete step-by-step guide to quickly and easily setting up and printing with your new Color Label Printer!

A. CHOOSING A GOOD LOCATION

- Place the printer on a flat surface in a location with adequate air circulation to prevent internal heat build up.
- Do not place the printer near heat sources such as radiators or air ducts, or in a place subject to direct sun light, excessive dust, mechanical vibration or shock.
- Allow for adequate clearance in front of the printer to accommodate the printed label stock as it is leaving the printer to avoid the possibility of binding or jamming of the label stock.
- Allow for adequate overhead and left side clearance for opening the top cover to allow easy access to the label stock and ink cartridge. The Printer will require 9.5 inches (24 cm) of additional space on the left side to completely open the cover (Total = 26.75" or 68 cm). The Printer will require an additional 15.9 inches (40.4 cm) of overhead space to open the cover (Total = 25" or 63.5 cm).
B. UNPACKING AND INSPECTION

While unpacking your printer, inspect the carton to ensure that no damage has occurred during shipping. Make sure that all supplied accessories are included with your unit. The following items are included in the supply box:

- Power Adapter
- Separate Power Cord
- USB Cable
- Software Installer CD
- Cyan, Magenta, Yellow and Black Ink Cartridges
- Warranty Statement and Registration Card
- This Manual and other Printed Information

The following items are inside the printer supply roll area:
- Replaceable Print head
- Starter Roll of High Gloss Label Stock

Save the carton and packing materials. They will come in handy when transporting the printer.
C. IDENTIFYING THE PARTS

This illustration shows the front of the printer with its control buttons and LED indicator lights.

The **Pause Button** pauses the printer AFTER the printing of the current label has finished to allow for loading of label stock and ink cartridge.

The **Power LED** indicates that the printer is on and ready to receive print jobs.

The **Load/Feed Button** is pressed in order to load label stock if the printer does not automatically detect the stock. When stock is loaded each press of the button will cause one label to be fed from the printer.

The **Ink Low LED** will illuminate when a cartridge has 10% or less of its ink remaining.

The **Unload Button** will unload the installed label stock by reversing it through the printer. Make sure to tear off the printed labels before pressing the Unload Button.

The **Label Tear Bar** is a serrated edge for conveniently tearing your finished labels from the printer. The printer comes with a white tear bar guard. For smoother label feeding, leave the guard in place during printing. When you are ready to tear off a label, remove the guard, tear off the label and replace it.
This illustration shows the input ports and power switch found on the rear panel of the printer.

This illustration shows the interior of the printer.

**D. COMPUTER SPECIFICATIONS**

**Recommended PC Specifications**

For optimal printing speed you must have a PC with the following recommended specifications:

- Pentium Dual Core Processor
- 2 GB of RAM
- 10 GB of Free Hard Drive Space
A. LABEL AND ROLL SPECIFICATIONS

A wide variety of label stock can be used in the Printer. Refer to the specifications and settings in the following sections before ordering custom stock from Primera or any stock from another company.

Important! Test all custom made label stock with the intended printer before ordering large quantities! Primera will only assume responsibility for custom label stock ordered from Primera.

Label Sensing Methods

Method 1: Label Gap Sensing

Method 2: Thru-Hole Sensing

Method 3: Reflective/Black Mark Sensing (Black Mark must be printed on back side of label stock)

Note: See table below for Max and Min values in inches and mm.
### Label Stock

<table>
<thead>
<tr>
<th>Specification</th>
<th>Max</th>
<th>Min</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>Distance from edge of media to edge of label</td>
<td>Printer driver assumes 2 mm gap. However, this is adjustable via the left margin offset.</td>
</tr>
</tbody>
</table>

* The Reflective/Black Mark should be opaque to infrared light. The mark should be between the labels. The end of the mark should correspond with the beginning of the label.

** This is the recommended maximum. There are two factors that determine whether the printer will accept any particular stock thickness.

1. The ability for the printer to pull the paper through the print area.
2. The ability for the sensor to read through the backing if the sensor is set to die-cut.

If you are printing in continuous or reflective label sensing mode number 2 does not apply. The fact that the printer must read through the backing in die-cut mode will limit the thickness much more than the printers ability to pull the paper through the print area. However, if you adjust opacity level of the liner enough to allow the label to be seen by the stock sensor, the thickness will only be limited by the printers ability to pull it through the printer area. For these reasons the weight or thickness of the liner is a variable that can not easily be defined. Primera recommends and uses 40# liner with all label stock. **It is important to test all label stock with the intended printer before ordering large quantities!**
Note on Label Orientation: If you are using an applicator to apply your labels, be sure to order label stock with the correct orientation for your applicator. For example, most applicators will apply the side of the label first, so you will want to print the labels sideways.
B. INSTALLING LABEL STOCK

The following steps will guide you through loading label stock in your printer:

- Make sure power is connected and printer is on.
- Open the Top Cover.

1. Lift Here

2. Lower the Roll Guide and pull it outward to make room for your label stock.
3. Remove any shipping tape from your label stock roll to ensure that it can unroll freely, making certain that no adhesive portion is exposed. It is important to note that any exposed adhesive surface can attach itself to the inner workings of the print mechanism and cause a media jam.

4. Place your roll of label stock on the Roll Arm and push it inward until it touches the Roll Stop.

5. Flip up the Roll Guide and slide it inward until it touches the label stock. The Roll Guide will automatically pull back slightly to the correct position. There should be approximately a 1mm gap between the roll guide and the roll.

**Important Note:** Be aware that some label stock may have a core that is slightly too large for the roll or the labels may have wrapped unevenly causing some to stick out beyond the edge of the core. Both of these issues can cause feeding problems.
6. Pull the Movable Throat Guide outward to make room for the label stock.

7. Place the leading edge of the label stock under the "label stock" symbols on the Throat Guides. The label stock should be placed far enough into the throat of the printer to correctly position the Movable Throat Guide but not yet into the printer itself.

8. Slide the Movable Throat Guide inward until it almost touches the label stock.

**Important Note:** The label stock should be close enough to the Fixed and Movable Throat Guides to provide proper guidance but not close enough to pinch the label stock. (0-1 mm gap on either side)

If the label stock is pinched by the guides, poor print quality or feeding problems could result.

9. Feed the label stock further into the printer until it senses the label and automatically feeds it through the printer. If the printer fails to feed the label stock, press the Load/Feed button on the front panel while continuing to guide the label stock into the printer. If the printer does not automatically grab and feed the stock or continues to feed the stock without stopping check the Stock Sensor position or mode (Section 2C or 2D).
C. ADJUSTING THE LABEL STOCK TOF (TOP OF FORM) SENSOR

If you are using label stock other than standard square / rectangular diecut labels such as circular die-cut labels or through-hole stock use the instructions below to adjust the position of the label stock sensor. The sensor can be adjusted using the slide bar on the inside of the printer. Below the slide bar is a measurement which represents the distance between the edge of the label stock and the sensor. Measure the distance from the edge of the label stock to the correct position on the stock. Set the sensor to this measurement.

**Important Note:** You must adjust the Stock Sensor before loading nonstandard label stock.

**Label Stock Sensor Slide**

</tr>
</tbody>
</table>

Circular Labels

If you are using Circular Labels you must adjust the Stock sensor to correspond with the very top of the label where the circles are closest together. If the sensor is too far to the right or the left the printer will still sense the label but the image may be offset downward because the printer will start printing at the wrong position. If you are using stock that has multiple labels across make sure the sensor corresponds to a place on the stock that has a label and not a vertical gap.
The sensor can only be moved a maximum of 2.3 inches from the left side of the printable area. This means that the maximum diameter circular label that can be printed is 4.6 inches. For circular labels larger than 4.6 inches in diameter, you must have a black mark printed on the back of the label stock. This means that you must change the Stock Sensor Mode to Reflective. The printer will now look for the black mark representing the beginning of the next label instead of the diecut. For more information on changing the Stock Sensor Mode see Section 2D.

Through-Hole Labels
If you are using card stock or label stock that has a hole punch or a notch to identify a transition from backing to label, you can adjust the Stock Sensor to position it over the identifying mark.

D. SET THE STOCK SENSOR MODE

The stock sensor mode refers to the method the printer will use to detect the print starting position for each label. To adjust the stock sensor mode, open the PTStatus program. PTStatus automatically installs with your printer driver and can be accessed through the printer driver or as program that is accessible in the same manner as all other programs.

Important Note: Set the Stock Sensor Mode BEFORE loading label stock!
1. Connect the printer via USB and turn on the power. The Stock Sensor Mode setting is stored on printer main board so you will not be able to access it unless the printer is turned on and properly communicating with the computer.

2. Go to Start - Programs - Primera Technology - PTStatus.

3. Click on the Alignment Tab (3rd tab from top).

4. Click on the Stock Sensor Mode button.

5. Select the Stock Sensor Mode by clicking on the graphic that most closely corresponds to the stock you intend to install.

There are three sensor modes:

**Die Cut (Default).** If you are using standard die-cut labels that look similar to the graphic use this setting regardless of the size of the label. Also, use this setting for Through-hole label material where a hole is punched through each label or a notch is cut in the side.

**Reflective.** Use Reflective for label material where a black pre-printed line (black mark) on the back of the label stock indicates the break between labels. Black marks are required on clear label stock rolls, or label where the label waste matrix (waste) is left on the liner. Black marks can also be used for irregular shaped labels, circles larger than 4.6 inches or on any stock where the print starting position can not be sensed using the label itself.
Continuous. (Sensor off) If you have continuous stock with no
die-cut, reflective mark or holes, set the sensor type to
Continuous. This will turn off the stock sensor. In this mode
there is no way to set the print starting position. The printer
will simply start printing the first label and print each
subsequent label immediately after that previous one. To
produce a gap between prints simply add the desired amount
of white space to the end of the label being printed.

**Important Note:** You must also set the Stock Sensor Position (Section 2C)
so that the sensor is sensing the correct point on the label stock.

**E: SET THE OUTPUT MODE**

Toggle the Output Mode to set whether or not the last label
printed will be presented or left inside the printer. To adjust
the output mode, open the PTStatus program. PTStatus
automatically installs with your printer driver and can be
accessed through the printer driver or as program that is
accessible in the same manner as all other programs.

1. Connect the printer via USB and turn on the power. The
Output Mode Setting is stored on printer main board so
you will not be able to access it unless the printer is turned
on and properly communicating with the computer.
2. Go to Start - Programs - Primera Technology - PTStatus.
3. Click on the Alignment Tab (3rd tab from top).
4. Click on the Output Mode button.
5. Select the Output Mode by clicking on the corresponding
graphic.
There are two different output modes:

**Present labels - Yes (Default).** This setting will cause the printer to feed the last label printed forward so that it and the previously printed labels can be torn off using the tear bar. If no other jobs are sent to the printer within one second after the last label has printed, the last printed label will present for tear off.

**Present labels - No (Use with Rewinder).** In this mode the label stock does not move after the last label is printed. This means that part of the last label printed is still in the printer. This should be used only if you have a label rewinder attached. To retrieve the final label you must press the Load/Feed button on the printer control panel.
Section 3: Status Monitor (PTStatus)

PTStatus or Status Monitor is used to interact with the printer for gathering ink levels, maintenance, alignment, cost calculation and several other functions.

PTStatus automatically installs with your printer driver and can be accessed through the printer driver preferences or as a program on your Windows start menu.

1. Connect the printer via USB and turn on the power. The Status Monitor accesses most of the information it uses from the printer itself so the printer must be turned on and communicating for the program to open.

2. Go to Start - Programs - Primera Technology - PTPStatus
   Once open, the Status Monitor consist of four tabs that are arranged on the left side of the window. Each tab opens a screen that has various similar functions. The tabs will only be displayed if the printer is idle (not printing).
   - Ink Tab (First Tab). Displays ink levels, Print head life, pauses or cancels a job, displays print counter.
   - Cartridge Utilities Tab (Second Tab). Aligns Print Head, Cleans Print Head and Changes the Cartridges.
   - Alignment Tab (Third Tab). Adjust vertical and horizontal print alignment, Changes the Stock Sensor Mode and toggles the Output Mode.
   - Cost Tab (Fourth Tab). Calculates cost per label based on last label printed.

In addition to these functions you can also click the "i" icon to access the Primera Knowledgebase, contact tech support, gather version information or set applications options.
A: MONITORING INK LEVELS

Ink levels can be monitored at any time by using the Status Monitor. Immediately after printing starts the Status Monitor will display the ink levels in the lower right corner of your screen.

The print status will also be displayed on the top bar. At any time you may click the double up arrows to expand the window to standard mode. Click the double down arrows to revert to the smaller mode.

In the standard mode, the ink percentages and print head life will be displayed, along with four tabs and the Print Counter. The tabs will only be displayed if the printer is idle (not printing).

**Note:** If you are using multiple printers, an instance of the Status Monitor will open for each printer. If the Status Monitor is in small mode, each instance will automatically tile justified to the bottom right portion of the screen. The title of each instance will correspond to the printer name as shown in the Windows printer list.
B. PRINT HEAD LIFE GAUGE

Print Head life remaining is displayed in the status monitor. Hover your mouse over the icon to display more information.

Print Head Life is calculated by tracking the number of cartridges used in the print head. A print head is considered to be at zero life remaining after 26 black or 32 combined color cartridges. Print heads may still be used after there is zero life remaining. However, it could fail at any moment. Therefore, it is recommended that users purchase a back up print head at approximately 10% life remaining.

**Note:** If the print head life indicator is not displayed click the refresh button next to the Magenta ink display.

C. USING THE COST ESTIMATOR

The cost estimator is found on the last tab of the Status Monitor. The Status Monitor automatically opens as soon as you begin printing. However, you can also access it at any time as long as the printer is turned on and communicating by going to Start - Programs - Primera Technology - PTStatus.
Ink cost is automatically and continuously calculated based on the black and color cartridge costs entered. Only the last printed label cost is displayed. For reference, the print file and date of last print is displayed at the top of the window.

- Adjust the cartridge costs according to the actual price paid for them. The estimate does not take currency into account so you can assume that whatever value you entered is displayed in your currency.
- Save a screen capture of the cost by clicking the disk icon.
- Print a screen capture of the cost by clicking the printer icon.

**Important Note:** The cost per label represents the average cost per label over an entire run of labels. This means that the per label cost will decrease and become more accurate as the number of labels printed increases. This is because the ink that is used for beginning and periodic cartridge maintenance is divided into a larger number of labels.

### D. REPLACING INK CARTRIDGES / LOW INK WARNING

You can replace cartridges at any time or wait for the Low Ink Warning to prompt you to replace cartridges. Low Ink Warnings occur at the following levels:

- **10%** - If any cartridge is lower than 10% at the beginning of a job you will be prompted to change that cartridge. At this point you can change or ignore.
- **0%** - If any cartridge reaches 0% during a job you will be prompted to change that cartridge. At this point you can change or ignore. Under normal circumstances this will be your first warning. The 10% warning is only triggered at the start of a job.
- **-10%** - If at any point any cartridge is -10% you will be prompted to change that cartridge. You must change the cartridge to continue.
To change a cartridge, follow this procedure:

1. Press Pause and Load/Feed simultaneously -OR- click the Change Cartridge button on the second tab of the Status Monitor. The head carriage will move to the center of the print area for easy access.

2. Remove the cartridge by pressing the corresponding colored tab on the back of the print head. The cartridge will pop up slightly.

3. Remove the cartridge.
4. Locate a new cartridge and remove it from its packaging. Remove the foil outer package and the clear plastic shrink wrap. Also remove the cartridge cap.

**Note:** If you opened a cartridge but are not currently using it you can store the cartridge in the plastic cap shown above to prevent it from drying out.

5. Place the new cartridge into its corresponding colored slot. Press down near the back of the cartridge until it clicks into position.

**Important Note:** Make sure the cartridge is securely in place. An improperly positioned cartridge will cause no ink of that color to be printed.
Section 4: Printing from a PC

A. USING BARTENDER®

Primera Special Edition BarTender UltraLite is included with the LX900. Other programs can be used to print. If printing from other programs please follow the guidelines in Section 4D.

When you open BarTender you will be given the choice to select an existing label or create a new one using a wizard. Use the following instructions as a guide through the wizard setup process.

1. Choose "Start a new BarTender document..."
2. Select "Blank Template". Click "Next".

3. Select "Color Label 900". Click "Next".
4. Select "Specify Custom Settings". Click "Next".

5. Set the page size, width and height to match labels installed in the printer. Click "Next".
6. Check the "Picture" box to add a background photo or graphic to your label. Click "Next". If you click "Finish", the remaining default wizard options will be set and no picture will be added.

7. Select "Embedded Picture". Click the "File" Button to browse to the location of your photo/graphic file. Set the Size Method to "Stretch". Note the preview to the right. Click "Next" if you are satisfied with the layout of the photo or graphic.
8. Review the label setup summary. If it is correct, click "Finish". Your blank label will be displayed.

You can edit any of these settings by going to the File Menu and selecting "Page Setup". Basic and advanced settings are available on the various tabs.
B. ADD TEXT, BARCODES AND GRAPHICS TO A BARTENDER LABEL

Once you have created your label size you will need to add text, a barcode and/or graphics. This can be done using one of buttons on the button bar at the top of the screen.

Add Text. Click the Text button. Now click anywhere on your label. “Sample Text” will appear. Edit the text on screen or double click it to open up text settings to change font, size and other settings.

Add Barcode. Click the Barcode button. Now click anywhere on your label. A barcode settings window will appear. Here you can choose any type of barcode and enter the value.

Add Graphic. Click the Image button. Now click anywhere on your label. An Image icon will appear. Double-click it to open up image settings and browse to the image/graphic that you would like to insert.

Print. Click the Print button to start printing.

Page Setup. Click the Page Setup button to change your label size, adjust corner radius or change the shape.

Lines. Click the Line button to add a horizontal or vertical line.

Tip! Double-click any object to open settings for that object.

Tip! Go to the Help menu to access the BarTender Manual and Tutorials.
C. PRINTING FROM BARTENDER

1. To print, click the Print button or go to the File Menu and select "Print". The Print Dialog window will appear.

2. Select the Color Label 900.
3. Set the number of copies.
4. Click "Print".
D. PRINTING FROM OTHER PROGRAMS

Since this printer uses a standard Windows printer driver you can print from any application you would like. There are just a few things to remember that will make it much easier.

1. **Set the Page/Label Size in the Driver.** BarTender automatically prompts you for the size of the label that you are using. When printing from any other program you must do this manually. Before you print, simply set the custom page size just as you would set print quality in the printing preferences. In the example below the label size is 4” x 4” so the custom page size is set to 400 x 400 (displayed in .01 inch units).

2. **Check the image or document size.** The image size or document size should correspond to the Page/Label Size set in the driver. If you have set your page size to 4” x 4” but your image is actually 5” x 3” the printer driver will automatically shrink your image to fit inside the 4” x 4” label. The result is that the actual printed label is 4” x 2.4”. Avoid this by setting your page size or image size to match the label size.

*Printing from a PC* 29
3. **Choose the right printing program.** There are many different applications that are capable of printing to the LX900. However, there are only a few that are ideal printing applications. For example, Adobe Illustrator is an excellent design program but is not always the best printing program. It can be difficult to find the printing preferences or to know the exact size of the art board. It is best to save as a PDF file and print from Adobe Reader or export as a 300 dpi JPG and print from BarTender.

### E. ADJUSTING PRINT ALIGNMENT

If your previous experience with printing is limited to printing letters and cards to 8.5 inch by 11 inch paper you probably are not familiar with an essential part of a label printing - Print Alignment. Standard printers feed a sheet and start printing based on the start of the sheet. They also prohibit printing to the edge of the sheet. This is to avoid any need for alignment. The LX900 senses the beginning of the label with an optical sensor and is capable of printing to top, bottom, left and right edge. Because of this it is necessary to align the printer to work with specific types of label stock.

The LX900 comes factory calibrated to print exactly to the edge of Primera label stock. However, due to variations in the left margins and other variables it may be necessary to fine tune these settings at the beginning of each roll. This is especially true for other non-Primera brand label stock.

**Important Note:** Before adjusting alignment settings first print one label at the quality level you intend for the entire job. This will ensure the label stock is moving at the same speed and the stock sensor will sense the gap in the same way.
Adjust print alignment using the Status Monitor. Go to the Alignment Tab (third tab).

Three items can be adjusted here:

- **Tear off Position.** This value adjusts the position of the last label printed after it has been presented for tear off. This only applies if the output mode is set to "Present the label." Add to the current value to move the tear point closer to the printer. Subtract from the current value to move the tear point away from the printer. After adjusting the value click the "Set" button to send the value to the printer.

- **Left Margin Offset.** This value moves the printed label left or right. Add to the current value to move the printed label to the right. Subtract from the current value to move the printed label to the left. After adjusting the value, click the "Set" button to send the value to the printer. Note: Before adjusting this value make sure the label stock is properly loaded so that there is no gap between the edge of the liner and the fixed throat guide. Any gap at this point will greatly affect the Left margin offset value needed to align the label. Also, if you adjust the value with improperly loaded label stock you will have to adjust it again if you load the label stock correctly the next time.

- **Top of Form (TOF).** This value moves the print start position up or down on the label. Add to the current value to move the printed label down or toward the printer. Subtract from the current value to move the printed label up or away from the printer. After adjusting the value click the “Set” button to send the value to the printer.
You may have to make several adjustments to one or more of these values. After each adjustment you can click the Test button to print a small test pattern on the label. This will help you find the proper alignment value.

F. CREATING A FULL BLEED PRINT

1. If you are having trouble making the image cover the entire label, first make sure the image is printing at least as big as the label size you have selected. To accomplish this using BarTender, make the image a few millimeters larger than the label by dragging the image over the edge of the label on all sides. The bounding box around the image will turn red when it is over the edge of the label. Try printing again to see if it covers the entire label. If not, move on to step two.

2. Adjust these settings in the printer driver preferences to create a .05” (1.2mm) over bleed.

**Page Size.** Increase the page size width in the driver preferences by .1 inches. Increase the height by .1 inches. If you are using BarTender, simply change the size under the File Menu - Label Setup. Increase the size of the image to fit the new larger page size. If you are using other graphics programs you will need to change the page size in the application and in the printer driver preferences.

**Left Margin Offset.** You must decrease the left margin offset to center the over bleed on the label. If you over bleed by .05” you will need to decrease the Left Margin Offset by 12. This will center the page size increase so there is a .05 inch over bleed on both left and right sides.
TOF. Decrease the Top of form by 10. This will cause the printer to start printing before the label and ensure a fully printed label.

Note: It is best to over bleed as little as possible to avoid excess ink on the label backing. Also, over bleeding too much will cause the printer to skip labels. This is because the printer stops printing too late to sense the next label.

G. PRINTER DRIVER SETTINGS

Once the printer driver has been successfully installed, you will need to setup the driver with the appropriate print options. Refer to the following steps to change or verify your default printer driver preferences. These settings will apply to all new designs created in BarTender or other programs after the preferences were changed. Existing labels saved in BarTender will not be affected since the preferences are saved with the label. To change these preferences you will have to change printer preferences through BarTender. (File Menu - Printer Settings)
**To find Driver Settings:**

Click the **Start** button, choose **Printers and Faxes (XP)**, **Printers (Vista)**, **Devices and Printers (Windows 7)**. Right-click on the Color Label 900 Icon and select **Printing Preferences** from the drop-down menu.

The preferences screen will appear.

**Note on PC Settings:**

Most applications allow you to change these same printer driver options from their “Print” and/or “Printer Setup” screens. Some applications such as BarTender save your settings with the label, others use settings only for the current print job just sent to the printer.
Paper Size

If you are using BarTender, this setting is adjusted during the label setup wizard. If you are using a program other than BarTender you will need to set this to the dimensions of your label. Keep in mind that the dimensions are always relative to the width and height of the actual label in the printer. Orientation of an image on the label should not change this setting. See Section 2A for minimum and maximum label sizes.

Orientation

There are two settings for orientation, Portrait and Landscape. If your text and graphics print left to right or as shown on the screen, select portrait. If you wish your printing to rotate 90 degrees from what you see on the screen so it is printing horizontally, select landscape as your orientation. Remember, this does not change the width and height Paper Size. It is only a tool for viewing a label upright on screen that will be printed sideways on the printer.

Print Quality

There are 4 levels of print quality in the driver. The lower the Quality, the faster the print. Quality 1 provides the fastest print available while Quality 4 provides the best quality. It is recommended that you experiment with the different levels when designing your label to find a good balance between print quality and print speed. Quality 2 is the default.
Ink Cartridge

*Color + Black* is best for images that have large areas of black graphics or text. Although you can print these same images with just the color cartridge, often the blacks will look darker with this setting.

*Color* is the default setting and is best for most images. With this setting the printer only uses the color cartridge to produce all colors including gray scale black and white images.

*Monochrome Black* is for images that have large black areas or black text. This will ensure that no color ink is being used. In some cases printing JPG files using Color + Black for an image that is all black will still cause some color ink to be used. Monochrome Black is not recommended for gray scale images such as a black and white picture. The ink spits of a black cartridge are not as small as the color cartridge. This allows for faster black printing but at a lower dpi. Using just the black cartridges for such images may result in a grainy image.

Media Type

There are multiple media type options which correspond with the various types of label stock sold by Primera. Match this setting to the media installed in the printer to achieve the closest color match to the screen. Each of these settings employs a slightly different color table developed specifically for the media type listed.

If the printed output is not matching the color on screen, regardless of what media you have installed you can adjust this setting to change the color output. You can experiment with this setting and the color matching setting to adjust the color of the printed image.

Color Matching

*Best for Graphics* mode is best used for graphical images where accurate color reproduction is not as essential. Images printed in this mode will look more vibrant because more ink is being used to produce them. However, printing images of people may produce skin tones that have a reddish tint.
Best for Photos mode is best used for photographic images where accurate color reproduction is very essential. Images printed in this mode will look lighter than those printed in Photo mode. Skin tones especially will look more natural in this mode.

Note: Exact color matching of the printed labels to the screen may never be possible since there are factors that affect this out of the drivers control. The surface of the label reacts with the ink in the cartridge to produce the color. For this reason, when printing the same image to different types of labels with different surfaces the printed output can look entirely different.

Ink Saturation

This option controls the amount of ink used when printing an image. The default setting is 100%, which will provide the most accurate color matching. If the ink is not drying fast enough or "bleeding", you can decrease the Ink Saturation to lessen the amount of ink that is applied to the label.

Enable Bi-di Printing

This setting defaults to “Yes” for fastest bidirectional printing.

Stock Sensor Mode

Click this setting to open the Status Monitor. See Section 2D

Output Mode

Click this setting to open the Status Monitor. See Section 2E

Print Alignment

Click this setting to open the Status Monitor. See Section 4D

Cartridge Maintenance

Click this setting to Align the Print Head, Clean the Print Head or Change a Cartridge. This setting opens the Status Monitor.
A. PRINTER UTILITY SETTINGS (COLOR LABEL 900 UTILITY)

The Color Label 900 Utility is used to interact with the printer for gathering ink levels, maintenance, alignment, cost calculation and several other functions.

Once the printer driver has been successfully installed, you will need to set up the driver with the appropriate print options. Refer to the following steps to change or verify your default printer driver preferences. These settings will apply to all labels printed through your Mac programs.

To Find Color Label 900 Utility:

Color Label 900 Utility automatically installs with your printer driver and can be accessed through the Printer Setup in Mac under Apple Icon – System Preferences - Print and Fax (Mac 10.5 and 10.6), Print and Scan (Mac 10.7 and 10.8), Setup, and Utility.

1. Connect the printer via USB and turn on the power. The Color Label 900 Utility accesses most of the information it uses from the printer itself so the printer must be turned on and communicating for the program to open.

2. Go to the Apple Icon – System Preferences - Print and Fax (Mac 10.5 and 10.6), Print and Scan (Mac 10.7 and 10.8), Setup, and Utility. Once open, the Color Label 900 Utility has 4 tabs that are arranged on the top of the window. Each tab opens a screen that has various similar functions.
   - **Cartridges Tab** (First Tab). Displays utilizes for aligning the print head, cleaning the print head, and changing cartridges.
   - **Alignment Tab** (Second Tab). Adjusts vertical and horizontal print alignment. Changes the Stock Sensor Mode and toggles the Output Mode.
- **Cost Tab** (Third Tab). Calculates cost per label based on last label printed.

- **Info Tab** (Fourth Tab). Displays Printer Information including firmware version, driver version, total prints, and the default Saturation level for all labels printed.
Set the Stock Sensor Mode

The stock sensor mode refers to the method the printer will use to detect the print starting position for each label. To access the Stock Sensor Mode, click on the Alignment button, then select Stock Sensor Mode.

**Important Note:** Set the Stock Sensor Mode **BEFORE** loading label stock! You must also set the Stock Sensor Position (Section 2C) so that the sensor is sensing the correct point on the label stock.

**Die Cut (Default).** If you are using standard die-cut labels that look similar to the graphic use this setting regardless of the size of the label. Also, use this setting for through-hole label material where a hold is punched through each label or a notch is cut on the side.

**Reflective.** Use Reflective for label material where a black pre-printed line (black mark) on the back of the label stock indicated the break between labels. Black marks are required on clear label stock rolls, or labels where the label waste matrix (waste) is left on the liner. Black marks can also be used for irregular shaped labels, circles larger than 4.6 inches or on any stock where the print starting position can not be sensed using the label itself.
Continuous. (Sensor off.) If you have continuous stock with no die-cut, reflective mark or holes, set the Sensor Type to Continuous. This will turn off the stock sensor. In this mode there is no way to set the print starting position. The printer will simply start printing the first label and print each subsequent label immediately after the previous. To produce a gap between prints simply add the desired amount of white space to the end of the label being printed.

Set the Output Mode

Toggle the Output mode to set whether or not the last label printed will be presented or left inside the printer. To adjust the Output Mode, open the Printer Utility by going to Apple Icon – System Preferences – Print and Fax (Mac 10.5 and 10.6), Print and Scan (Mac 10.7 and 10.8). Click on the Color Label 900 and Select Open Print Queue. Select Setup – Utility – Open Utility. Select Alignment – Output Mode. Select the Output Mode by clicking on the corresponding graphic.

Present Labels – Yes (Default). This setting will cause the printer to feed the last labels printed forward so that it and the previous printed labels can be torn off using the tear bar. If no other jobs are sent to the printer within one second after the last label has printed, the last printed label will present for tear off.
Present Labels – No (Use with Rewinder). In this mode the label stock does not move after the last label is printed. This means that part of the last label printed is still in the printer. This should be used only if you have a label Rewinder attached. To retrieve the final label you must press the Load/Feed button on the printer control panel.

Set Ink Saturation

This option controls the amount of ink used when printing an image. The default is 100%, which will provide the most accurate color matching. If the ink is not drying fast enough or is bleeding you can decrease the Ink Saturation to lessen the amount of ink that is applied to the label. To locate the Ink Saturation setting, click on Info in the Color Label 900 Utility.

To change the saturation level, enter the desired value and then click Set.
Using the Cost Estimator

The Cost Estimator is found under the Cost tab in the Color Label 900 Utility.

![Cost Estimator Interface]

Ink cost is automatically and continuously calculated based on the black and color cartridge costs entered. Only the last printed label cost is displayed. For reference, the print file name and number of labels in the run is displayed at the top of the window. Adjust the cartridge costs according to the actual price paid for them. The estimate does not take currency into account so you can assume that whatever value you entered is displayed in your currency.

**Important Note:** The cost per label represents the average cost label over an entire run of labels. This means that the per label cost will decrease and become more accurate as the number of labels printed increases. This is because the ink that is used for beginning and periodic cartridge maintenance is divided into a larger number of labels.
B. PRINTING FROM SWIFT PUBLISHER

1. **Set the Page/Label size in the Program.** Swift Publisher will always make a new blank template without prompting for a paper size. Select File – New for a new document. Before you start designing your label simply set the custom page size in the upper right hand corner to the size of the label stock installed in the LX900. Also make sure to set the Document Margins to ‘0’.

2. **Set the Paper Size in the Print Options.** Once your document is created and ready to print go to File – Print. The following screen will appear. Before doing anything else, click the Page Setup button and set the paper size for the printer. This should correspond to the label size installed in your printer. If your label size is not listed you will need to create a custom page size. See instructions in the next step.
3A. Create a Custom Page Size (Optional). When your document is done and you are ready to print go to File – Print. If the paper size you need to print to is not already in the drop down menu options select Manage Custom Sizes.

3B. Add a New Custom Paper Size. Click the plus (+) button to add a new custom paper size. Enter the size on the right. Be sure to adjust the top, bottom, left and right margins to 0. Change the name from "untitled" to the size of your custom page (W x H). When you have finished adding your new custom page size, this size will appear in your drop down menu options for paper size on future print jobs.
4. **Set the Print Quality Settings.** After selecting your paper size, select Printer Features from the drop down selection. Change your printer settings to the desired quality. When you have finished adding your page size and selecting your print quality settings, press Print.

**C. PRINTING FROM ADOBE ILLUSTRATOR**

1. **Set the Page/Label size in the Program.** Create your document using the File – New command. Set your width and height to correspond with the label stock installed in the LX900. Also be sure to set the bleed size to ‘0’ for Top, Bottom, Left, and Right.
2. **Set the Paper Size in the Print Options.** Once your document is created and ready to print go to File – Print. The following screen will appear. Before doing anything else, click the Page Setup button and set the paper size for the printer. This should correspond to the label size installed in your printer. If your label size is not listed you will need to create a custom page size. See instructions in the next step.
3A. Create a Custom Page Size (Optional). If the paper size you need to print to is not already in the drop down menu options select Manage Custom Sizes.

3B. Add a New Custom Paper Size. Click the plus (+) button to add a new custom paper size. Enter the size on the right. Be sure to adjust the top, bottom, left and right margins to 0. Change the name from "untitled" to the size of your custom page (W x H). When you have finished adding your new custom page size, this size will appear in your drop down menu options for paper size on future print jobs.
4. Set the Print Quality Settings. After selecting your paper size, click the Printer button to change the print quality settings for this print.

Select Label Printer Settings from the drop down selection. Change your printer settings to the desired quality.

When you have finished adding your page size and selecting your print quality settings, press Print.
D. PRINTING FROM ADOBE ACROBAT READER

1. Set the Page/Label size in the Program. Open up your .pdf file and select File – Page Setup. Select your paper size from the Paper Size drop down menu. This should correspond to the label size installed in your printer. If your label size is not listed you will need to create a custom page size. See instructions in the next step.

2A. Create a Custom Page Size (Optional). If the paper size you need to print to is not already in the drop down menu options select Manage Custom Sizes.
2B. Add a New Custom Paper Size. Click the plus (+) button to add a new custom paper size. Enter the size on the right. Be sure to adjust the top, bottom, left and right margins to 0. Change the name from "untitled" to the size of your custom page (W x H).

3. Set the Print Quality Settings. After selecting your paper size, click File - Print. Click Copies and Pages on the print preview screen.

A drop down menu will appear. Click Printer Features.
Change your printer settings to the desired quality. Click Print.

E. CREATE A CUSTOM LABEL SIZE

1. Create a Custom Page Size. Open the program you would like to print from and select File – Page Setup. Using the Paper Size drop down menu select Manage Custom Sizes.
2. Add a New Custom Paper Size. Click the plus (+) button to add a new custom paper size. Enter the size on the right. Be sure to adjust the top, bottom, left and right margins to 0. Change the name from "untitled" to the size of your custom page (W x H).

F. ADJUSTING PRINT ALIGNMENT

If your previous experience with printing is limited to printing letters and cards to 8.5 inch by 11 inch paper you probably are not familiar with an essential part of label printing – Print Alignment. Standard printers feed a sheet and start printing based on the start of the sheet. They also prohibit printing to the edge of the sheet. This is to avoid any need for alignment. The LX900 senses the beginning of the label with an optical edge. Because of this it is necessary to align the printer to work with specific types of label stock.

The LX900 comes from the factory calibrated to print exactly to the edge of Primera label stock. However, due to variables it may be necessary to fine tune these settings at the beginning of each roll. This is especially true for other non-Primera brand label stock.

**Important Note:** Before adjusting alignment settings first print one label at the quality level you intend for the entire print job. This will ensure the label stock is moving at the same speed and the stock sensor will sense the gap in the same way.
1. Adjust print alignment using the Color Label 900 Utility. Go to Apple Icon – System Preferences – Print and Scan. Select the Primera Color Label 900 and select Open Print Queue.

Adjust print alignment using the Color Label 900 Utility. Go to Alignment – Print Alignment.

Three items can be adjusted here:

* **Tear off Position.** This value adjusts the position of the last label printed after it has been presented for tear off. This only applies if the output mode is set to “Present.” Add to the current value to move the tear point closer to the printer. Subtract from the current value to move the tear point away from the printer. After adjusting the value click the Set Offsets button to send the value to the printer.

* **Left Margin Offset.** This value moves the printed label left or right. Add to the current value to move the printed label to the right. Subtract from the current value to move the printed label to the left. After adjusting the value, click the Set Offsets button to send the value to the printer. **Note:** Before adjusting this value make sure the label stock is properly loaded so that there is no gap between the edge of the liner and the fixed throat guide. Any gap at this point will greatly affect the Left Margin Offset value needed to align the label. Also, if you adjust the value with improperly loaded label stock you will have to adjust it again if you load the label stock correctly the next time.

* **Top of Form (TOF).** This value moves the print start position up or down on the label. Add to the current value to move the printed label down or toward the printer. Subtract from the current value to move the printed label up or away from the printer. After adjusting the value click the Set Offsets button to send the value to the printer.
You may have to make several adjustments to one or more of these values. After each adjustment you can click the Test Offsets button to print a small test pattern on the label. This will help you find the proper alignment value.

**G. CREATING A FULL BLEED PRINT**

1. If you are having trouble making the image cover the entire label, first make sure the image is printing at least as big as the label size you have selected. Increase the selected page size by .05 inches on the width and .05 inches on the height to create an over bleed. Make sure under scaling options to select 'Fit to Page' in the print dialogue box if printing from Illustrator.

   **Left Margin Offset.** You must decrease the Left Margin Offset to center the over bleed on the label. If you over bleed by .05 inches, you will need to decrease the Left Margin Offset by 12. This will center the page size increase so there is a .05 inch over bleed on both the left and right sides.

   **TOF.** Decrease the Top Of Form by 10. This is cause the printer to start printing before the label and ensure a fully printed label.

   ![Image of label settings](image)

   **Note:** It is best to over bleed as little as possible to avoid excess ink on the label backing. Also, over bleeding too much will cause the printer to skip labels. This is because the printer sops printing too late to sense the next label.
A. SOLVING PRINT ALIGNMENT PROBLEMS

Image is Vertically Offset

The LX900 decides where to start printing by detecting the start of die-cut label, detecting a black mark on the back or detecting a thru-hole that corresponds to the start of the label.

The following items can cause the label sensor to improperly detect the start of a label:

1. **Top of Form (TOF).** TOF stands for Top of Form and this setting allows you to fine tune the alignment of your printing on your label stock. This will be factory calibrated. If fine tuning is needed, increase this setting to move the image down on the label; decrease this setting to move the image up on the label. The unit of measure is 0.1mm. This setting is found on the Alignment Tab of the PTStatus Monitor.

2. **Nonstandard / Non-translucent Backing Material.** Test the unit with the label sample material that came with the unit. If it prints correctly, your label stock may not be compatible. The label sensor needs to see the difference between a label and a backing material by seeing through the label stock for light variations. If it can not see through the label, problems will arise. If you must use this type of backing, try label stock that has a black mark on the back to show where the label begins. You will need to change the Stock Sensor Mode in the Status Monitor.
3. **Insufficient Label Gap Distance.** See Section 2A for label specifications.

4. **Page Size is Bigger than Label Stock Size.** If the page size set in the driver is larger than the actual label stock, ink will be printed on the gaps and the sensor will start looking for a gap too late. This can cause label skipping or inconsistent print starting points.

5. **Portrait / Landscape.** If the Portrait / Landscape setting does not correspond to the label stock installed this will also cause the printer to print over the gap and onto the next label. Make sure this is set correctly.

6. **Stock Sensor Position.** Circular, nonstandard label shapes or multiple labels across will require precise adjustment of the label sensor. If you are using circular or other non-rectangular die-cut labels see Section 2C for instructions.

The image is printing horizontally offset

Three things can affect this issue.

**Label Stock Loading.** It is very important to correctly load the label stock so that there is no space between the throat guides and the label liner edge. If there is a gap between the throat guides and the label stock it may “walk” back and forth causing inconsistent horizontal printing. See section 2B for label stock loading instructions and tips.

**Left Margin Offset.** This adjustment is found on the Alignment tab of the PTStatus monitor. See Section 4D.
**Page Size.** Often the page size is not large enough for the label. If this is the case you may see white space on the right (printers left) side of the label and no image overlap on the opposite side. This indicates that the page size needs to be increased. Increase the page size through the printer preferences enough to cover the label.

### B. SOLVING PRINT QUALITY PROBLEMS

Many factors can affect the quality of the print. The following are listed in order from most likely to least likely:

1. **Quality Setting.** Change your quality setting. The lowest (and fastest printing) quality may not be sufficient for many photos or graphics. The highest quality setting may cause ink to bleed on certain graphics in combination with certain label stock. Increasing the quality increases print time because the printer makes more horizontal movements across the label.

2. **Clean the Print Head.** Run an automatic print head cleaning print or manually clean the print head as described in Section 5F.

3. **Change Cartridge.** Try a new cartridge. Make sure that the ink cartridge has ink remaining. Check the ink levels via the Status Monitor.

4. **Align Print Head.** Normally, print head alignment is only necessary after changing a print head. However, in certain cases, running the alignment again can improve print quality. Align the print head by opening the PTStatus Monitor. Click on the Align Print Head button on the Cartridge Utilities Tab (second tab). Follow the onscreen prompts to load your paper for alignment.
5. **Clean the Maintenance Station.** Clean the maintenance station located on the right side of the print area. This includes the rubber cartridge nozzle cap and the plastic squeegee. Under normal use this can become dirty with ink. Clean with rubbing alcohol and a paper towel.

6. **Color Matching.** Change your Color Matching setting to Graphics or Photos via the printer driver preferences. See Section 4F.

7. **Cartridge Setting.** Change the cartridge setting in the driver. Try Color + Black or Color only. To change the cartridge setting, right click on the printer in the Printers and Faxes area - choose preferences - click cartridge - set it to Color + Black or Color. Color only will still print black, but will use the color cartridge to print it. We recommend "Color" only for the best possible quality on photographic images with small amounts of black. If your image has large areas of black text, graphics or barcodes, we recommend Color + Black for the best quality.

8. **Media.** Make sure your label stock is inkjet printable. Many thermal label stocks look the same as inkjet but do not allow the ink to soak into the surface of the media.
9. **Source File Image Mode.** The image mode of the source file may be set to RGB instead of CMYK. This can cause the color matching to be off. Change the image mode of the original file, resave and reprint.

10. **Copper Contacts.** Clean the copper contacts on the back of the print carriage and the contacts on the print head with rubbing alcohol.

11. **Image Resolution (DPI).** Try another Image. Perhaps the resolution of the current image is not sufficient for a quality print. Many graphics suitable for viewing onscreen have a DPI of 72. This is the minimum DPI for proper screen display. However, if you print this image it will look blurry and pixilated. 72 is a typical DPI for images or graphics saved from web sites. We recommend a 300 dpi image.

12. **Cable.** Try another USB cable. Make sure that it is less than 6ft (2 Meters) long. Faulty cables or cables that are too long interrupt communications which can result in print quality issues.

13. **Saturation.** If ink is bleeding, decrease saturation in driver preferences.

14. **Change the Print Head.** If print nozzles of certain colors are still clogged after repeated cleanings it may be time to replace the print head. See Section 5G.

### C. COLOR MATCHING AND DESIGN TIPS

Whether you contract your graphic design or do it yourself, these guidelines will help you get the best quality labels out of your LX900.

1. **Image Size/Shape.** The image size should correspond with the size of the label you will be printing. Note: If the source image is smaller and must be enlarged to fill the entire label space, this will affect the DPI. A 2” x 2’ 300 dpi label blown up to fit on a 4” x 4” label would have an effective dpi of 75. This would not be a sufficient resolution. See item 2.
2. **Resolution.** Resolution is measured in dots per inch or dpi. 300 dpi is sufficient to get the best possible quality from most images. A 72 DPI image will look fine on screen but WILL NOT print well. Graphics and logos found on websites are typically 72 DPI. The image below was printed from a 72 DPI image. Notice the jagged edges. Remember, print quality settings found in the label printer driver will have no effect on improving a low dpi source image.

On the other hand, resolutions higher than 300 DPI will not produce better quality but may require more RAM to print and hard drive space to store. They could even slow down the print process.

3. **Image File Format.** Most graphics are created in a graphic application. Since this graphic application is not usually on the same computer as the label printer doing the printing, it is necessary to export the graphic into a universal format that can be read by other programs. We recommend TIF and BMP files for graphics. These formats are uncompressed. JPG files also work well for graphics that include photographs. All three formats can be imported into the BarTender application.
4. **Color Mode.** Set the color mode in the source graphic application to CMYK. In most cases this will produce the most accurate color reproduction of the image on screen. However, if CMYK is not producing the desired color matching try changing the source image to RGB and then exporting the image again in one of the universal formats mentioned above.

**Note:** Often it is useful to request that your graphic designer provide you with several different formats for you to try printing. For example you could request your image in six different formats: A JPG, BMP, and TIF in RGB color mode and a JPG, BMP and TIF in CMYK color mode.

5. **Media Type Setting.** Experiment with the Media Type setting in the printer preferences (Section 4F) to achieve the best color matching. There are multiple media type options which correspond with the various types of label stock sold by Primera. Match this setting to the media installed in the printer to achieve the closest color match to the screen. Each of these settings employs a slightly different color table developed specifically for the media type listed.

If the printed output is not matching the color on screen, regardless of what media you have installed you can adjust this setting to change the color output.

If you are still not getting the correct color output, the graphic designer may need to change the color values of the source graphic to achieve the proper print output.
D. CREATE A SUPPORT REPORT

If you are encountering any problems with your LX900 tech support may ask you to create a Tech Support Report. You can do this from the Status Monitor by clicking the "i" icon and clicking Create Report... A zip file will be create on your desktop.

E. CLEANING THE PRINTER

If any ink has gotten on to the printer casing itself, the case of the printer can be cleaned with an ammonia based window cleaner and a lint-free cloth.

Over time, ink overspray may gather at the base of the printer. The printer is designed using a vacuum system to gather most of this ink on a series of saturation pads. Eventually, these pads may need to be replaced. Contact tech support to determine if pad replacement is necessary.

F. CLEANING THE PRINT HEAD

It may be necessary to clean the print head nozzles if you notice reduced print quality, missing colors or if you suspect an cartridge nozzle has become slightly dried out or clogged. Try the following solutions:

1. Secure Cartridges. Make sure the corresponding cartridge is snapped into place. Remove and reseat the cartridge to make sure an air tight connection has been made. You should hear a "click" when the cartridge is installed properly.
2. **Clean the Copper Contacts.** Ink over spray can build up inside the printer over time causing interrupted electrical signals. Remove the print head and clean the copper contacts on the print head carrier and the print head. (Area 1, 2 and 4 below). Do not clean the print nozzles! (Area 3).

3. **Clean the Print Head.**
   DO NOT touch the print head nozzles with a tissue or paper towel. This can damage the nozzles! This may be different that previous printers. Instead used the methods described below:
   1. Open PTStatus monitor.
   2. Click Clean print head on the Cartridge Utilities Tab (second tab).
3. Make sure the "purge cartridges before clean" box is checked. Follow the onscreen prompts. You will need a sheet of paper for this process.

You may need to repeat this process up to 4 times depending on how clogged the print head is. Only repeat the procedure if you start to see improvement after each clean print.

During this process the printer will make several loud whirring noises. This is normal! This is the sound of a pump forcing ink through the nozzles. If you do not hear this sound, the clean purge print did not complete successfully. Try again.

4. **Preventing clogged nozzles.**

Clogged nozzles on the print head can be caused by non use of the printer for extended periods of time. Follow these guidelines:

- Always keep the LX900 plugged in and turned on. The printer will do periodic maintenance to make sure the nozzles do not clog.
- Never store a used print head outside of the printer. The nozzles will dry out with exposure to air. If you must store a print head outside of the printer, place full or empty cartridges in the print head and put the entire print head and cartridges in a sealed plastic bag.
- Use the printer regularly!

5. **Quality Setting.** Change your quality setting. The lowest (and fastest printing) quality may not be sufficient for many photos or graphics. The highest quality setting may cause ink to bleed on certain graphics in combination with certain label stock. Increasing the quality increases print time because the printer makes more passes over the media.

6. **Backup Print Head/Cartridge.** The cartridge may be empty or defective. The print head nozzle for one color could be clogged. The fastest way to diagnose a quality problem is to have backup print heads and cartridges available for comparison testing. If one color is missing, replace that color cartridge(s). Next try replacing the print head.
7. **Defective Print Head/Cartridge Replacement Procedure.**

If you think your cartridge/print head is defective, please contact tech support to arrange for a replacement. Tech support may ask you to perform troubleshooting before sending a replacement cartridge or print head.

**Notes on Ink/Print Head Replacement**

- All replacements for defective cartridges or print heads must be processed through Tech Support.
- To receive replacement cartridges, you may be required to send in your defective cartridges/print head.
- Tech Support will perform the cleaning procedures and tests mentioned above on all cartridges/print heads received.
- Tech Support will not replace cartridges with less than 50% ink remaining.
- Print heads with zero percent life remaining will not be replaced.
- Print heads with greater than zero percent life remaining prints may be replaced depending on the description and circumstances of the failure at the discretion of Primera Tech Support.

**Replaceable Print Head - Part Number 53450**
G. REPLACING THE PRINT HEAD

Regular replacement of the print head is not necessary. However it may become necessary if you notice a gradual decrease in print quality or if some of the print nozzles are still clogged after repeated manual cleanings as described in Section 5E.

Follow this procedure:

1. Press the Pause and Load/Feed buttons simultaneously to move the print carriage to the center of the print area.

2. Remove all cartridges. Press the release tab at the front of the carriage to release the latch.
3. Remove the print head. Grasp the print head near the back as shown in the illustration.

4. Locate a new print head and place it in the carriage.
5. Close the latch until you hear a click.

6. Press the Pause and Load/Feed buttons simultaneously to move the print carriage back to normal position.

7. Now align the print head as described in Section 5B.
H. INTERPRETING THE PRINTER’S INDICATOR LIGHTS

Most error messages will appear on your computer screen via the Status Monitor application. However, if the error prevents communication with the computer the LED lights may be used to help diagnose the problem.

<table>

I. TECHNICAL SUPPORT

If you have difficulties in operating your Printer, the procedures in this manual and the software User’s Guide should, in most cases, solve the problem. If you still have difficulty, contact the technical support using one of the methods listed below.
